50 HTML Interview Questions

1. What is HTML?

HTML is basically the foundation of any website. It helps us structure content like headings, text, images, and links on a webpage.

---

2. What are HTML tags?

Tags are like building blocks. We use them to define different parts of a webpage, like paragraphs, headings, or images.

---

3. What is an HTML element?

An element is a complete piece — it includes the opening tag, the content, and the closing tag. For example, a paragraph element.

---

4. What is HTML5?

HTML5 is the latest version of HTML. It made things easier by adding features like video, audio, and better structure with semantic tags.

---

5. What is the basic structure of an HTML page?

Every HTML page has a basic structure: html, head, and body. The head contains information, and the body shows content.

6. Why do we use `<!DOCTYPE html>`?

It tells the browser that we are using HTML5, so the page renders correctly.

---

7. What are attributes?

Attributes give extra information to elements. For example, in an image tag, `src` tells where the image is coming from.

---

8. Difference between `<div>` and `<span>`?

A div takes full width and is used for layout, while span is inline and used for small styling inside text.

---

9. What are block elements?

These elements take full width and start on a new line, like paragraphs or divs.

---

10. What are inline elements?

Inline elements don’t break the line. They just take as much space as needed, like links or spans.

---

11. What are semantic tags?

Semantic tags clearly tell what the content is about. For example, header, footer, and article — they improve readability and SEO.

---

12. Difference between id and class?

An id is unique and used once, while a class can be reused multiple times.

---

13. What is DOM?

DOM is like a tree structure of the webpage that JavaScript can use to interact with elements.

---

14. Why use alt attribute?

It helps describe the image if it doesn’t load and also improves accessibility for screen readers.

---

15. What is iframe?

It allows you to embed another webpage inside your webpage, like embedding a YouTube video.

---

16. What is an HTML form?

A form is used to collect user input like login details, search queries, etc.

---

17. What are input types?

There are many types like text, email, password, number — each used for specific input.

---

18. GET vs POST?

GET sends data in the URL and is less secure. POST sends data in the body, so it’s more secure and used for sensitive data.

---

19. What is label tag?

It connects text with an input field, making forms more user-friendly.

---

20. What is textarea?

It’s used when you need multi-line input, like comments or messages.

---

21. What does `<form>` do?

It acts as a container to collect and submit user data.

---

22. Radio vs Checkbox?

Radio allows only one option, while checkbox allows multiple selections.

---

23. What is placeholder?

It’s a hint inside an input field showing what to enter.

---

24. What is required attribute?

It makes sure the user fills the field before submitting the form.

---

25. What is pattern?

It allows us to validate input using a specific format, like email or phone number.

---

26. What is autocomplete?

It helps users by suggesting previously entered values.

---

27. Fieldset and legend?

They help group related form fields and give them a title.

---

28. Button vs submit?

Submit automatically sends form data, while button is more flexible and needs JavaScript.

---

29. What is name attribute?

It identifies form data when sending it to the server.

---

30. How does validation work?

HTML checks input rules like required or pattern before allowing submission.

---

31. localStorage vs sessionStorage?

localStorage stores data permanently, while sessionStorage clears data after the session ends.

---

32. Cookies vs localStorage?

Cookies are sent to the server and are smaller. localStorage is bigger and stays in the browser.

---

33. What are meta tags?

They provide extra information like character encoding and SEO details.

---

34. What is responsive design?

It means the website adjusts properly on mobile, tablet, and desktop screens.

---

35. What are void elements?

These are elements without closing tags, like image or line break.

---

36. Section vs Article?

Section is for grouping content, while article is independent content like a blog post.

---

37. What is accessibility?

It means making websites usable for everyone, including people with disabilities.

---

38. What are ARIA attributes?

They improve accessibility by giving extra information to assistive technologies.

---

39. What are data-* attributes?

They allow storing custom data inside HTML elements.

---

40. What is SEO in HTML?

Using proper tags like title, headings, and meta to improve search ranking.

---

41. async vs defer?

Async loads script immediately, while defer waits until HTML is fully loaded.

---

42. `<strong>` vs `<b>`?

Strong gives importance, while b is just visual bold.

---

43. `<em>` vs `<i>`?

Em adds meaning (emphasis), while i is just styling.

---

44. `<link>` vs `<a>`?

Link connects external files like CSS, while anchor creates clickable links.

---

45. What is favicon?

It’s the small icon shown in the browser tab.

---

46. Script in head vs body?

Putting script in body improves page loading performance.

---

47. What is viewport?

It controls how the page looks on mobile devices.

---

48. What is lazy loading?

Images load only when needed, improving performance.

---

49. What is canvas?

Canvas is used to draw graphics using JavaScript.

---

50. What is SVG?

SVG is used for scalable graphics like icons and logos.
